Project Name	Automated-Network-Request Management
Maximum Marks	2 Marks

Problem Statement

In modern organizations, network-related service requests such as new network connections, relocations, device-related requests, and connectivity requirements are often dependent on multiple manual steps. Traditional request handling can result in **delays, incorrect routing, approval bottlenecks, repetitive work, and limited visibility into request status.**

The proposed **Automated Network Request Management in ServiceNow** addresses these challenges by providing a centralized self-service mechanism for submitting network requests and automating their subsequent processing. The system captures the required request information through a structured service catalog, routes requests for approval, creates the required records, and sends notifications based on the request status.

Key Problems Identified

1. Manual Request Processing

Network requests may require several manual activities, increasing processing time and effort.

2. Approval Delays

Requests requiring authorization can be delayed when approval processes are handled manually.

3. Incorrect or Delayed Routing

Without an automated workflow, requests may not reach the appropriate team or responsible person efficiently.

4. Lack of Transparency

Users and IT teams may have limited visibility into the current status of a request.

5. **Repetitive IT Workload**

IT teams spend time performing repetitive request-handling tasks that could be automated.

6. **Limited Standardization**

Network requests may contain incomplete or inconsistent information when submitted without a structured form.

7. **Notification Gaps**

Users may not receive timely updates regarding approvals, processing, or completion.

Problem Statement Summary

To develop an automated ServiceNow-based network request management system that simplifies request submission, standardizes information collection, automates approvals and record creation, provides timely notifications, and improves visibility throughout the request lifecycle.

This aligns with the project's stated objective of streamlining network-service requests through ServiceNow's **service catalog, workflow engine, approval processes, notifications, and automation capabilities.**
