Ideation Phase – Empathize & Discover

This **Empathy Map** identifies the needs, expectations, frustrations, and behaviors of users involved in network-service requests. It is based on the project's identified challenges such as manual processing, approval delays, lack of visibility, repetitive IT work, and the need for automated notifications.

Use the generated map above directly in your documentation.

Key insight:

Users need a **simple, transparent, and automated way to submit network requests, receive approvals, track progress, and get timely updates**, while IT teams need to

reduce repetitive manual work. This leads to the proposed **Automated Network Request Management System in ServiceNow.**
