

Solution Requirements

Date	15-08-2026
Project Name	Automated-Network-Request Management
Maximum Marks	4 Marks

The **Automated Network Request Management in ServiceNow** solution requires a centralized and automated platform for submitting, processing, approving, fulfilling, and tracking network-related service requests. The requirements are based on the project's objective of reducing manual processing, improving request visibility, and automating approvals, task assignments, and notifications.

1. Functional Requirements

ID	Requirement	Description
FR01	Network Request Submission	The system shall allow users to submit network-related requests through a ServiceNow Service Catalog.
FR02	Structured Request Form	The system shall capture required information such as connection type, device type, address, device details, and other relevant information.
FR03	User Information	The system shall capture requester details such as user name, email ID, and phone number.
FR04	Conditional Fields	The system shall display relevant fields based on user selections, such as displaying an additional field when the device type is selected as "Others."
FR05	Request Record Creation	The system shall automatically create a network request record after the catalog request is submitted.
FR06	Approval Management	The system shall send applicable requests for approval and support approval or rejection decisions.
FR07	Task/Record Assignment	Approved requests shall generate the required network records or tasks for fulfillment.
FR08	Request Fulfillment	The network team shall be able to process and update the request according to its requirements.

ID	Requirement	Description
FR09	Notifications	The system shall send email notifications to relevant users or teams during important stages of the request lifecycle.
FR10	Record Updates	The workflow shall update the network request record according to the processing and approval status.

These requirements correspond to the implemented Flow Designer sequence of **Get Catalog Variables → Create Record → Ask for Approval → Flow Logic → Send Email → Update Record**.

2. Non-Functional Requirements

ID	Requirement	Description
NFR01	Usability	The request form should provide a simple and user-friendly experience for submitting network requests.
NFR02	Automation	The system should minimize manual activities by automating routing, approvals, record creation, and notifications where applicable.
NFR03	Reliability	Requests should be processed consistently according to the configured workflow and approval rules.
NFR04	Transparency	Users and IT teams should have visibility into request status and processing.
NFR05	Efficiency	The solution should reduce processing delays and repetitive workload for IT teams.
NFR06	Scalability	The solution should support different types of network requests and additional request variables as requirements grow.
NFR07	Maintainability	Catalog items, variables, UI policies, tables, and workflows should be configurable within ServiceNow.

3. Technology Requirements

- **ServiceNow Platform**
- **Service Catalog** for network request submission
- **Catalog Variables** for collecting request information
- **Catalog UI Policies** for dynamic form behavior

- **ServiceNow Tables** for storing request and network information
- **Flow Designer** for workflow automation
- **Approval mechanism** for request authorization
- **Email Notifications** for communicating request status
- **ServiceNow reporting/analytics** for monitoring request volume, resolution time, and SLA adherence.

Requirement Summary

The solution must provide an **end-to-end automated network request process** that captures accurate information, routes requests for approval, creates the necessary records/tasks, supports fulfillment, updates request status, and keeps users informed through notifications. This directly supports the project's goal of faster processing, improved transparency, and reduced manual effort.
